

AI Agent Operations Engineer

AVAILABILITY
Remote · Contract
Part-time or full-time

Early-career builder focused on AI-assisted operations, workflow design, and product execution. I turn ambiguous requests into inspectable systems, work comfortably across technical and nontechnical contexts, and care about the human judgment around automation—not only the model call.

CORE SKILLS

AI Operations

Agent workflows, human review, prompt iteration, tool orchestration, execution evidence

Product & Delivery

Requirement shaping, workflow mapping, stakeholder updates, prioritization, documentation

Engineering

Python, TypeScript, React, Starlette, SQLite, REST APIs, MCP, Git

Data & Interfaces

Dashboard design, seeded datasets, filtering, visualization, operational metrics

WORKING STYLE

- Starts from the operator decision and works backward.
- Uses AI tools as leverage while retaining human review.
- Communicates progress and constraints clearly in remote work.
- Prefers complete, inspectable loops over isolated demos.

ROLE FIT

- AI-native engineering and operations
- Agentic workflow coordination
- Production and product operations
- Technical project delivery

SELECTED PROJECT EXPERIENCE

AgentOps Desk

FULL-STACK CASE STUDY

Builder · Agent Governance & Operations

- Built a unified MCP gateway that exposes large tool catalogs through four discovery and execution meta-tools, reducing context overhead for connected agents.
- Implemented scoped API keys, per-tool and per-account rate limits, expiry, IP controls, stealth responses, and a complete audit trail for every tool call.
- Designed an operator console that surfaces failed and state-changing actions, preserves exact request and response evidence, and supports acknowledge or escalate decisions.
- Created deterministic demo data and a seeded review workflow so hiring teams can exercise the full product without external accounts or credentials.

Stack: Python, Starlette, SQLite, MCP, server-rendered HTML/CSS, role-based access control

FleetLens

REACT / MCP CASE STUDY

Builder · Revenue Intelligence & Data Product

- Adapted an open-source MCP dashboard system into a branded revenue command center with a new product narrative, navigation, visual system, and deployment-ready static demo.
- Modeled a 12-deal operating dataset and combined \$1.05M open pipeline, \$599K weighted forecast, stage mix, expected close value, aging, and next actions in one view.
- Added owner, stage, segment, and region filters so operators can move from portfolio-level signal to deal-level evidence without changing tools.
- Kept the workflow reproducible: the seeded dataset, dashboard schema, rendering path, and static publish output ship together.

Stack: TypeScript, React, Vite, MCP, JSON data modeling, responsive data visualization

Government Collaboration Project

STAKEHOLDER DELIVERY

Operations & Delivery Contributor

- Supported a public-sector collaboration by translating stakeholder requests into structured work items, documented decisions, and clear delivery updates.
- Coordinated information across technical and nontechnical participants, keeping dependencies and open questions visible rather than relying on informal handoffs.
- Prepared concise progress materials and synthesized feedback into the next executable steps for the project team.

EVIDENCE OF FIT

Ambiguity → execution

Both builds start from an operating problem, not a fixed implementation ticket.

AI with judgment

Human review, policy, and evidence are first-class product behavior.

Technical breadth

Works across backend policy, data modeling, interfaces, and deployment.

Remote-ready

Async documentation, explicit state, and reproducible demos support distributed teams.
